

Centralized Group Management for Multi-Site Clinics.

Six integrated capabilities that unify clinical records, operational workflows, inventory and financial management across a distributed healthcare network.

INTEGRATED GROUP PLATFORM — SIX CAPABILITIES

Clinical, operational and financial management — fully unified.

Common EMR & Seamless Patient Experience

A single patient identity is maintained across all branches, giving every clinician access to the complete clinical history at any site, on any device, without re-registration.

Central Lab / Radiology

Laboratory and DICOM results are routed directly into the clinical record as soon as they are available, removing duplicate data entry and reducing turnaround time.

Central Inventory Management & Fixed Assets

Implant and consumable stock levels are visible in real time across all branches, ensuring that availability at one location is never compromised by limited visibility at another.

Centralized Claim Management

All branches are supported by a single claims function. Clinical documentation maps directly to coding and submission, supporting lower rejection rates and shorter collection cycles.

Centralized Reporting & Analytics Dashboard

Group performance is presented in real time, covering case volume, revenue, utilization and referral trends across every branch.

Seamless Patient Referral System

Internal referrals across specialties are raised, routed, acknowledged and closed within the platform, ensuring each patient is followed throughout the full care journey within the group.

ONE CONNECTED NETWORK

What a unified group *looks like in practice.*

When every branch operates on one platform, the group ceases to behave as a set of separate clinics and begins to function as a single organization. The following outcomes describe that end state.

1

One patient identity

Every patient is known to the group as a single identity, with one continuous record maintained across all branches and specialties.

2

One source of truth

Clinical, operational and financial information resides on one platform, removing the need to reconcile data between separate systems and sites.

3

Real-time group oversight

Leadership maintains a live, network-wide view of performance, without reliance on manual reporting from individual branches.

4

Predictable cash flow

Documentation, coding and claims operate as a single, consistent process, supporting cleaner submissions and shorter collection cycles.

5

Faster, lower-risk expansion

New branches are provisioned in the cloud and join the network already connected, allowing the group to grow without rebuilding infrastructure at each site.

WHY THIS MATTERS FOR YOUR NETWORK

- ✓ Distributed branches operating as a single, coherent network
- ✓ High case volumes managed with real-time operational intelligence
- ✓ Cloud-native — no per-branch server infrastructure required
- ✓ New sites onboarded rapidly through cloud provisioning
